The `numeric` style

This style prints numeric citations in square brackets. It is similar to the standard bibliographic facilities provided by LaTeX and to the `plain.bst` style of legacy BibTeX.

Additional package options

The `subentry` option

The option `subentry` affects the handling of citations referring to members of a reference set. If this option is enabled, such citations get an extra letter which identifies the member (it is also printed in the bibliography): [1a, 2c, 1c, 2b, 6]. This option is disabled by default, but it has been enabled in this example. If disabled, citations referring to a set member will point to the entire set, i.e., the above citations would come out as [1, 2, 1, 2, 6].

`\cite` examples

`\parencite` examples

With the numeric style, `\parencite` and `\cite` behave the exactly the same.
